**EFFECT OF AGEING ON PHYSICO-CHEMICAL PROPERTIES OF
NON-DAIRY ICE CREAM MIX**

By

WAN ROSNANI AWG ISA

April 2004

Chairman : Associate Professor Mohd Yazid Abdul Manap, Ph. D.

Faculty : Food Science and Biotechnology

The rheological characteristics of ice cream mix prepared from palm oil (PO), palm kernel oils (PKO) and their blends with anhydrous milk fat (AMF) at 30:70, 50:50 and 70:30 ratios during ageing were studied. The experimental ice cream mixes were compared with a control sample prepared from AMF. Ice cream mix containing 33.44% total solids including 10% fat, 11.09% milk solid-non fat (MSNF), 12% sugar, 0.35% commercial blend of emulsifier/stabiliser and water. The rheological properties such as the flow behaviour, Newtonian viscosity (η_0) and compliance (J_0) were measured after ageing at 4°C for 0, 0.5, 1, 1.5, 2 and 24 hr and determined using a controlled stress rheometer (Haake RS 100). The Power Law and Casson equation was employed to estimate the yield stress (τ_0) of an ice cream mixes. The correlation coefficients (r) for the regression analyses of the square root of the shear stress-shear rate data were represented well by the

Casson model ($r > 0.99$) for all the samples, indicating goodness of fitted. The shapes of the curves of consistency coefficients (K_c) were quite similar for all the experimental samples. The flow behaviour index (n) of the ice cream mixes prepared with palm fraction (PO and PKO) and their blends were less than 1.0 (range 0.04-0.08) indicating that the mixes were pseudoplastic fluid. The η_o at shear rate 20^{-1} indicated that the degree of viscosity in the control sample was higher.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Master Sains

**KESAN PENUAAN KEATAS SIFAT- SIFAT FIZIKAL-KIMIA
CAMPURAN AIS KRIM BUKAN TENUSU**

Oleh

Pengerusi : Profesor Madya Mohd Yazid Abdul Manap, Ph.D.

Fakulti : Sains Makanan dan Bioteknologi

Sifat-sifat reologi campuran ais krim daripada minyak kelapa sawit (PO), minyak isirong sawit (PKO) dan campurannya dengan lemak susu anhidrous (AMF) pada nisbah 30:70, 50:50 dan 70:30 semasa penuaan dikaji. Campuran ais krim mengandungi 33.44% jumlah pepejal termasuk 10% lemak, 11.09% pepejal susu tanpa lemak (MSNF), 12% gula, 0.35% pengemulsi/penstabil dan air. Sifat-sifat reologi seperti pelakuan aliran, kelikatan Newtonian (η_0) dan komplian (J_0) diukur selepas penuaan pada 4°C untuk 0, 0.5, 1, 1.5, 2 dan 24 jam dan dikenalpasti menggunakan rheometer kawalan tekanan (Haake RS 100). Persamaan Power Law dan Casson digunapakai untuk menganggarkan hasil tekanan (τ_0) campuran ais krim. Korelasi koofisi (r) untuk analisa regrasi data punca ganda dua tekanan shea- kadar shea adalah diwakili dengan baik oleh model Casson ($r > 0.99$) untuk semua sampel, menunjukkan padanan yang

terbaik. Bentuk graf konsistensi koofisi (K_c) adalah hampir sama untuk semua sampel kajian. Indeks pelakuan aliran (n) campuran ais krim yang disediakan dari pecahan minyak kelapa sawit (PO dan PKO) dan campurannya adalah kurang daripada 1.0 (range 0.04-0.08) menunjukkan mereka adalah cecair pseudoplastik. η_o pada kadar shea 20^{-1} menunjukkan darjah kelikatan yang tinggi pada sampel kawalan.

ACKNOWLEDGEMENTS

All praise to God, the Most Gracious and Merciful, for giving me the strength, health and determination to complete my research studies.

My utmost gratitude, honor and sincere appreciation to my supervisor Prof Madya Dr. Mohd Yazid bin Abd Manap for his invaluable guidance, encouragement, constructive suggestion and criticism and patience throughout the study and during the preparation of this thesis.

My heartfelt appreciation and gratitude go to the members of my supervisory committee Dr. Nor Aini bt Idris and Dr. Dzulkifly bin Mat Hashim for their generous guidance, valuable comments during the study and for reviewing my manuscript and making valuable comment, cooperation and assistance throughout my research studies.

I am really thankful and indebted to the Malaysian Palm Oil Board who has given me the time and financial support to pursue my studies.

Finally, I wish to thank my family, relatives, friends and all the staff at Malaysian Palm Oil Board especially Mrs. Chow Mei Chin for the use of Haake Rheometer RS 100 and to the Faculty of Food Science and Biotechnology, University Putra Malaysia who had contributed in one way or another towards the success of this study. May God bless you always.

I certify that an Examination Committee met on 23rd April 2004 to conduct the final examination of Wan Rosnani Awg Isa on her Master of Science thesis entitled "Effect of Ageing on Physico-chemical Properties of Non-Dairy Ice Cream Mix" in accordance with Universiti Pertanian Malaysia (Higher Degree) Act 1980 and Universiti Pertanian Malaysia (Higher Degree) Regulations 1981. The Committee recommends that the candidate be awarded the relevant degree. Members of the Examination Committee are as follows:

SUHAILA MOHAMED, Ph.D.

Professor
Faculty of Food Science and Biotechnology
Universiti Putra Malaysia
(Chairman)

MOHD YAZID ABD MANAP, Ph.D.

Associate Professor
Faculty of Food Science and Biotechnology
Universiti Putra Malaysia
(Member)

NORAINI IDRIS, Ph.D.

Research Officer

CHAPTER 1

INTRODUCTION

Ice cream mix is an oil-in-water emulsion. It is formulated using fat, milk solid non-fat (MSNF), sugar, emulsifier and stabiliser. The fat phase in the form of minute globules is dispersed into the aqueous phase in the ice cream mix. Each globule is coated with a layer of adsorbed milk proteins, which keep the mix stable during ageing, whipping and freezing stages of manufacturing process that contribute to the development of the ice cream structure. The quality of the mix components, together with factors such as processing condition, type of emulsifying agent and the flavour added affect the quality of the end product. The composition of the mix affects the rheological properties during ageing, the amount of air incorporated in the mix and the ice crystal formation during freezing. In a normal process of ice cream making, the accepted time for ageing the mix is about six hr. However, prolonged ageing is require to achieve the stabilisation of the mixture and this could be costly and time consuming. In a commercial production, the ageing time could be reduced or eleminated to reduce the cost without adverse effect on the stability of the mix.

Dairy fats are widely used in the production of ice cream. They are primarily derived from milk, cream, butter and anhydrous milk fat. Milk fat is the major fat component in ice cream, contains 70% saturated fatty acids and a high percentage of

cholesterol. Most countries require the use of dairy fat, but some countries like the United Kingdom and Finland allow the use of vegetable fats in ice cream. In the United States, a product made with vegetable fat must be labelled as “Mellorine”. In most Asian countries which have a limited supply of milk, the price differential between animal and vegetable fats has led to the growing use of vegetable fat as a fat substitute in dairy products especially in ice cream.

Palm oil and palm kernel oil are already being used as fat ingredient in local ice cream manufacture. These oils are also being used in formulating the ice cream with incorporating of other oils by ice cream manufacturers worldwide. Besides being comparatively cheaper than milk fat, the range of palm oil and its fraction continue to increase. These oil could be tailored to meet the specific technological requirements such as the melting point, solid fat content, fatty acid, triacylglyceride composition and iodine value. Moreover, palm oil and its fractions have the advantages of abundant supply and a uniform quality, longer storage time and better consistency at room temperature compared to milk fat. They have a natural colour, bland taste and are similar in their physical properties which allow them to be used as a milk fat substitute with no marked changes in flavour or consistency.

Substitution of palm-based fat in an ice cream formulations may affect the rheological properties as well as the viscosity of the mix. Changes in viscosity are related to the changes in processing condition such as the rate of freezing and the growth of ice crystals during freezing. Such changes affect the texture of the end
